Projects

Real-Time Sign Language Interpretation Data Classification
Date: Jan 1, 2021
Associate with University of Technology Sydney

Project Owner: Chen Chen
Project Type: Data Science, Computer Vision
Project Date: Jan 1, 2021 to Dec 31, 2021
Project Status: Not Started
Project Location: Remote

Overview:
Sign language is a complex language composed of a wide variety of signs, in which hand shapes, movements, and facial expressions are used to convey information. Although sign language is a natural language, it is not universally understood by people at large. Moreover, technology is not yet sufficiently developed to be able to translate sign language into other languages. Therefore, a real-time sign language interpretation system is needed to facilitate communication between people who speak different sign languages.

Project Goals:
- Collect sign language data
- Implement a deep learning model (CNN) and Optical Flow to extract the spatial and temporal features of sign language
- Implement a deep learning model (LSTM) to classify the sign language
- Implement a real-time sign language interpretation system based on the trained model
- Implement a real-time sign language translation system based on the trained model and a translation dictionary
- Implement a real-time sign language translation system based on the trained model and a translation dictionary, and a text-to-speech module
- Implement a real-time sign language translation system based on the trained model and a translation dictionary, a text-to-speech module, and a speech-to-text module
- Implement a real-time sign language translation system based on the trained model and a translation dictionary, a text-to-speech module, a speech-to-text module, and a GUI

Tech Stack/Skills:
- Tensorflow/Keras
- Computer Vision
- Deep Learning
- Natural Language Processing
- Speech Recognition
- Text-to-Speech
- Speech-to-Text
- Python
- Tkinter

Skills: Computer Vision, Deep Learning, Keras, Tensorflow, Natural Language Processing, Text-to-Speech, Speech-to-Text

Learning Text Representation
Date: Jan 1, 2021
Associate with University of Technology Sydney

Project Owner: Chen Chen
Project Type: Data Science, Machine Learning
Project Date: Jan 1, 2021 to Dec 31, 2021
Project Status: Not Started
Project Location: Remote

Overview:
Text representation is the first step in natural language processing (NLP) and is the foundation of all other NLP tasks. Although there are many pre-trained word embeddings available, it is still important to develop a text representation model for specific domains, because the meaning of words may be different in different domains. For example, the word "cell" means a biological cell in the domain of biology, but it means a mobile phone in the domain of telecommunication.

Project Goals:
- Implement a word2vec model
- Implement a GloVe model
- Implement a fastext model
- Implement a BERT model
- Implement a text representation system based on the trained model
- Implement a text representation system based on the trained model and a text classification module
- Implement a text representation system based on the trained model and a text classification module, and a GUI

Tech Stack/Skills:
- Tensorflow/Keras
- Natural Language Processing
- Deep Learning
- Machine Learning
- Python
- Tkinter

Skills: Natural Language Processing, Deep Learning, Machine Learning, Keras, Tensorflow, Python, Tkinter

Human Action Video Dual Stream Fusion in BERT
Date: Jan 1, 2021
Associate with University of Technology Sydney

Project Owner: Chen Chen
Project Type: Data Science, Deep Learning, Computer Vision
Project Date: Jan 1, 2021 to Dec 31, 2021
Project Status: Not Started
Project Location: Remote

Overview:
Human action recognition in videos plays a crucial role in many video based applications, such as video surveillance, human-computer interaction, and video retrieval. Although many deep learning models have been developed for human action recognition, it remains a challenging task because of the complex spatial and temporal information in videos. Two-stream convolutional neural networks (CNN) have been proved to be effective in human action recognition. In this project, we propose a two-stream fusion model based on BERT to further improve the performance of human action recognition in videos.

Project Goals:
- Implement a two-stream convolutional neural network (CNN) for human action recognition in videos
- Implement a two-stream fusion model based on BERT for human action recognition in videos
- Implement a two-stream fusion model based on BERT for human action recognition in videos, and a GUI

Tech Stack/Skills:
- Tensorflow/Keras
- Computer Vision
- Deep Learning
- Convolutional Neural Network
- Natural Language Processing
- Transformer
- Python
- Tkinter

Skills: Computer Vision, Deep Learning, Convolutional Neural Network, Natural Language Processing, Transformer, Keras, Tensorflow, Python, Tkinter

Text Classification in Natural Language Processing
Date: Jan 1, 2021
Associate with University of Technology Sydney

Project Owner: Chen Chen
Project Type: Data Science, Machine Learning, Natural Language Processing
Project Date: Jan 1, 2021 to Dec 31, 2021
Project Status: Not Started
Project Location: Remote

Overview:
Text classification is a fundamental task in natural language processing and has a wide range of applications, such as sentiment analysis, spam detection, and topic labeling. Although there are many deep learning models have been developed for text classification, it remains a challenging task because of the complex semantic and syntactic information in text. In this project, we propose a text classification model based on BERT to further improve the performance of text classification.

Project Goals:
- Implement a text classification model based on BERT
- Implement a text classification model based on BERT, and a GUI

ACM SIGMM Conference Design Exhibition
Date: Jan 1, 2021
Associate with Kaiserslautern Center

Project Owner: Dr. Ali Mirzaei
Project Type: Data Science, Data Visualization, Graphic Design, Computer Vision, Deep Learning, Natural Language Processing
Project Date: Jan 1, 2021 to Dec 31, 2021
Project Status: Not Started
Project Location: Remote

Overview:
Multimedia research and conferences serve as the forum and venue for the presentation and discussion of the latest scientific results. Although the quality of the scientific results is the most important factor, the presentation of the results is also important. In this project, we will design an exhibition for the ACM SIGMM conference.

Project Goals:
- Implement a text classification model based on BERT
- Implement a text classification model based on BERT, and a GUI

Tech Stack/Skills:
- Tensorflow/Keras
- Computer Vision
- Deep Learning
- Natural Language Processing
- Transformer
- Python
- Tkinter
